TO: Director FBI

SUBJ:Possible Russian cyberattack in Denver

In response to your message, of 201708041500Z, we have found proof of intent to interfere in Colorado State elections. As confirmation we offer the following evidence.

The first portion that was decoded discussed how the FSB technical department requires IP addresses of state computers that will be used for voter registration. By spoofing the system administrators the FSB will gain access to Colorado voting servers. The following decoded message told Russian Nationalists, Agent Kavkaz and Agent Dmitri, to perform reconnaissance on the Secretary of State's office in Denver. By performing this recon, they will be able to determine electronic exploitations in the voter registration records. Agents Kavkaz and Dmitri were then directed to examine and identify potentials to add false voters to local voter registration. The Russian agents were then instructed to discover whether or not Colorado uses mail-in ballots or voting booths. The Russian Nationalist's final order was to find a subject with an Edward Snowden based personality type. For example, young, single, isolated, and self absorbed. Exploitation and manipulation were suggested tactics to be used to get the target to conduct espionage.

That is the end of the decoded message, here is the information gained from our surveillance of Agents Dmitri and Kavkaz in the Denver area. They were located first at the light rail station near the Performing Arts Complex. They were then tailed by our Cyber Defense Task Force to the Secretary of State's office at 1700 Broadway, Unit 200, 80290 on East 17th

20170831212105Z

Avenue. Multiple sightings of Kavkaz and Dmitri were reported throughout the city heading towards the Secretary's office. When the Agents were outside of the office, some of our task force were spotted by Kavkaz and Dmitri and they fled the area. Photographic evidence was obtained.

Therefore, we at CyberDefense highly recommend that these agents are apprehended, but more information is gathered before the Russians are accused of interfering with American elections. We also advise that all American voting systems should become more highly monitored and should be far more secured.
